DIGITAL STRATEGY

A CONTINUATION OF THE CREATION OF THE ACROPOLIS DIGITAL
MUSEUM 2014-2020 PROGRAM

(2024-2028)

PROGRAM OUTLINE:

❖ AN **INTRODUCTION**

❖ **PRIORITIZE LEARNING**

- VIRTUAL TOUR EXPANSION
- AUGMENTED REALITY (AR)
- LINK TO ACADEMIC ARTICLES

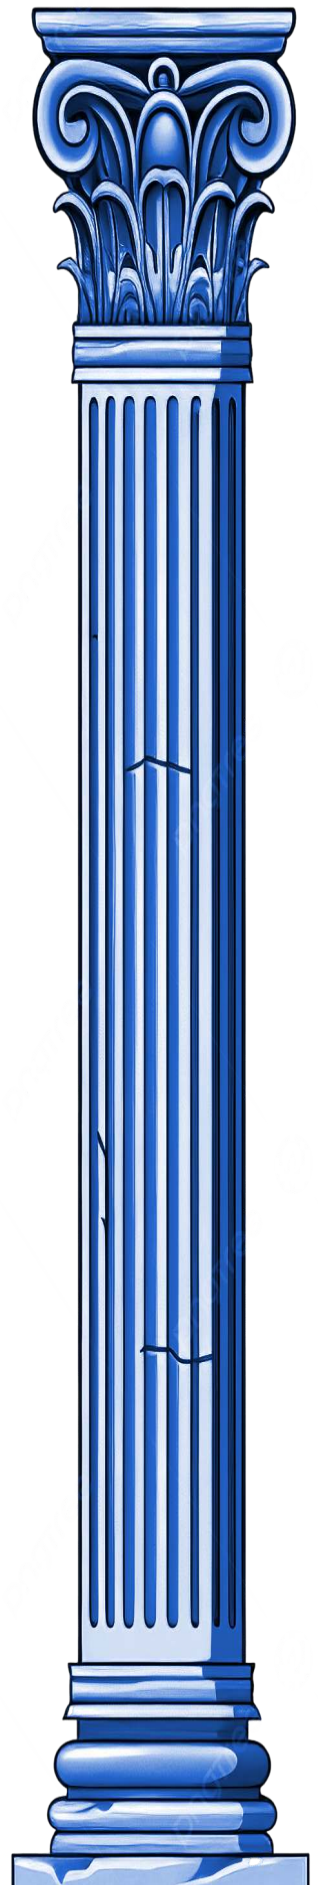

❖ **ACCESSIBILITY**

- MULTIPLE LANGUAGES
 - TEXT-TO-SPEECH
 - VIDEO SUBTITLES/ VOICE DUB
- MOBILE ACCESS

❖ **VISIBILITY**

- ENHANCE SOCIAL MEDIA USAGE
- USER ENGAGEMENT
- TIKTOK

❖ **CONCLUSION**

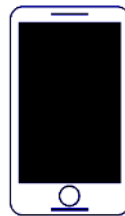

INTRODUCTION

The Acropolis Museum's Digital Museum utilizes new digital technology to communicate and engage with both physical and online visitors. The **Creation of Acropolis Digital Museum** program, which ran from 2014-2020, strived to create a digital space that provided the public with information on the collections and artifacts within the exhibits. This included digitizing the information and creating educational content.

The program brought the museum from the purely physical to the digital world, creating global accessibility. Although the Digital Museum program was a success and modernized this historic space, further development is needed to **enhance learning, accessibility, and visibility.**

LEARNING

ACCESSIBILITY

VISIBILITY

This document will outline how we intend to further develop the Digital Museum to include augmented reality, multilingual features, app creation, and social media. This strategy will improve the Acropolis Museum's digital space by providing new technologies for visitors and extending their accessibility to education and research.

PRIORITIZE LEARNING

The Acropolis Museum website has seen some recent additions through the Digital Museum project from 2014 to 2020. One of the greatest additions included a virtual tour of the museum, and an audio tour for the visually impaired. Another great addition included the digitization of all of the museum's artifacts.

Although these additions were resourceful and helped the museum engage with the community, upgrading these additions is needed to fully prioritize learning accessibility through the museum's website. This goal will be reached by acquiring new technologies and partnering with libraries in the area.

VIRTUAL TOUR EXPANSION

The website's virtual tour utilizes the 360° camera as it goes around the different exhibits in the museum. This allows the online visitor to look around the exhibits

and click in the direction they want to go. With the Virtual Tour Expansion, the online tour would include the artifacts shown within the video as the user hovers over them. The piece of art and a brief description would appear on the screen and once clicked, a full picture of the artifact would pop up with a more detailed description. This addition would create an easier learning space and allow for more online visitor interaction with the museum. This process would also include a text-to-speech button for the visually impaired.

A filmed guided tour for visitors who would rather be guided through the digital museum would also be added to the website. Although the self-guided virtual tour creates a more interactive experience for the online visitor, a filmed tour guide may be more helpful for visitors who may be overwhelmed by the exhibit selection, or need guidance through the exhibit.

The placement of the virtual tours will also be moved into a separate section within the website page. Currently, the virtual tours are placed under the “video” section of the website, which may be confusing for visitors looking through the website for the first time. Adding a separate “virtual tours” page makes it easy to find all of the different exhibition tours and audio tours as it would all be in one place, rather than being lost within the “videos” section of the website.

A film and programming team is needed for these goals to be met. A website designer may need to be hired to reorganize the website for this expansion.

AUGMENTED REALITY (AR)

Augmented reality can enhance the online interactive experience, and could make learning more fun for kids as well as adults. On the mobile version of the website or the new mobile app (**see page 8**), a new AR feature will be added to a specific artifact’s description page. This feature will allow the online visitor to place the artifact in their physical space through their cell phone. By bringing these artifacts into their space, it enhances their learning experience.

To achieve this goal, the museum would need to hire a team of programmers specialized in AR technology.

LINK TO ACADEMIC ARTICLES

Currently, the website has a page dedicated to specific publications from the Acropolis Museum. However, with the huge history surrounding the Acropolis and its different artifacts and sculptures, a website page filled with links to scholarly articles or research papers connected to the Acropolis would give outside access to students/researchers.

This page would be organized by publication date and have a search bar looking for keywords within articles. A language option would also be implemented near the top of the screen before searching is available.

This would be implemented with the help of a local library. A partnership may need to be set to implement this section within the website, along with a team of website designers.

ACCESSIBILITY

One of the most important goals of the Digital Museum project was to be inclusive of different languages and give global accessibility to the website. This new project will expand on that goal to add more language translation on their website and create their own mobile app to increase accessibility to information on the museum.

MULTILINGUAL

The website is able to translate into English, Greek, French, German, Spanish, and Italian. These languages are important to have as the Acropolis Museum is located in Greece and is surrounded by many countries that use these languages. However, these limitations cut off accessibility to other popular languages such as Arabic, Hindi, Japanese, Korean, Portuguese, etc.

Adding these languages will require translators and a team of programmers to add those different language selections to the website.

TEXT-TO-SPEECH

In addition to adding new language options to the website, a text-to-speech button should be added to any text-heavy page, artifact description, and page headline. This option would use an A.I. voice generator to read the text on the page in whatever language was selected prior.

VIDEO SUBTITLES/ VOICE DUB

Videos ranging from kid cartoons to full-on class lectures were created/recorded for the purpose of education. The website is full of different types of documentaries and other educational videos with the downside of them all being in Greek. The lack of subtitles or transcripts of the video dialogue creates a cut-off in access to who is able to watch and take from the video. These videos should include subtitles for multiple different languages and a voice dub for some of the kid videos to aid with the younger audiences who are not able to read.

This would need programmers, transcript writers for lectures or other recorded events, and an automatic translation feature such as A.I.

MOBILE ACCESS AND APP CREATION

The museum will create a mobile app to improve overall accessibility to information on the museum. An app is easier to use on a phone and can be accessed from almost anywhere in the world. The app would look similar to the website but formatted to fit a more mobile structure. The app would include interactive maps for people who are physically in the museum and provide menus for the different restaurants and cafes.

The museum would need to work with an app-developing team along with any important members of the museum who specialize in the museum's digital space.

VISIBILITY

A component that was not highlighted in the goals of the Digital Museum project from 2014 to 2020 was the overall visibility of the museum through social media. Currently the Acropolis Museum has a Facebook, Instagram and YouTube account. More engagement with social media accounts will appeal to a younger audience. Creating a TikTok account and linking it with their Instagram account allows for more user engagement with the museum and promotes the museum to audiences who may not have had known about it.

To achieve this goal, the Acropolis Museum will need to hire a Social Media Coordinator along with a team of social media interns to help gather content. This team will partner with the museum's Event Coordinator to plan events together and make sure they are covered.

ENHANCE SOCIAL MEDIA USAGE

The Acropolis Museum has a limited social media presence. The Instagram page does a good job of posting consistently and covering new artifacts or new programs/exhibitions being opened in the museum. The museum will start holding online events, whether it be live videos of lectures, or other small video

content on information about artifacts or exhibition spaces. Stories is another feature that will be utilized to enhance social media usage. Short snippets of videos, events, or new artifacts will be posted on Instagram "stories."

USER ENGAGEMENT

With the inclusion of Instagram stories to enhance social media usage, the museum will also focus on user engagement through social media. Giving the audience a voice and interaction through social media increases overall visibility for the museum. Polls are a good way of having users interact with a social media account. Putting polls on Instagram or X lets the museum have direct communication with their online visitors/followers.

TikTok

The Acropolis Museum will create a TikTok account run by Social Media Interns. TikTok is a great way to spread educational content along with content about upcoming events. The content will be humorous in nature to reflect the TikTok environment while also being appropriate for kids and teens. Keeping with the idea of language access, TikTok subtitles will be available for every video.

CONCLUSION

This Digital Strategy is an extension of the Creation of the Acropolis Digital Museum program of 2014-2020. This strategy focuses on digital learning, accessibility, and visibility. By utilizing new technologies and opening communication across the globe, the Acropolis Museum is able to further deepen their digital footprint by enhancing their digital spaces.
